

Lab 03 working copy

Use this self-contained FastAPI/SQLite/HTML-CSS-JavaScript project while completing Split Routes and Reuse a Service Function.

Focus: Refactor a monolithic FastAPI file into router and service modules without changing the contract.

Acceptance criterion: All baseline tests still pass and OpenAPI exposes each route exactly once.

The database is created locally when the service starts. Do not submit northstar.db, .env, virtual environments, caches, or live credentials.
