

Lab 09 working copy

Use this self-contained FastAPI/SQLite/HTML-CSS-JavaScript project while completing Design the Commerce CRM Database.

Focus: Create constrained products, customers, orders and order_items tables with relational integrity.

Acceptance criterion: Initialisation is idempotent and SQLite enforces unique SKU/email, valid money/stock, order status and foreign keys.

The database is created locally when the service starts. Do not submit northstar.db, .env, virtual environments, caches, or live credentials.
